[n.b. The Humanities Computing Program has undergone extensive revision and the present document is provided only for archival reference.]

The Humanities Computing Program is an interdisciplinary MA program, but since Humanities Computing is not a department, students have to be enrolled in a home department. Psychology participates in the program as a potential home department, and students in the program may seek an advisor from among Psychology faculty. Humanities Computing students take a total of nine courses, including two or three courses in their home department, and write a Master’s thesis in their second year in the program. (More information about the program can be found at http://huco.ualberta.ca.) There are no Departmental constraints on which courses in Psychology Humanities Computing students must take. When Psychology is the home department, Humanities Computing students count as Psychology students for the purposes of determining GAP funding. However, there is no expectation that the Department will provide funding or resources for Humanities Computing students unless expressly arranged with the Chair.
